ENCODED TAG DATA INTERFACE

-Encoded fixed data can be up to 120 bits long -Use 2 buffers to allow for 2 simultaneously READs in one cycle.
-These stores hold the fixed tag data for 1 tag.

-Total memory = 120x2 = 240 bits

RAW TAG DATA INTERFACE

-Use 2 buffers to allow for 2 simultaneously READs in one cycle. -Use 2 buffers to allow for simultaneously READ/WRITE

-Total memory = 360x2x2 = 1280 bits
-Min tag width = 126 dots
so the fastest that 1 tag can be read = 126/2 = 63 cycles

Once printing has started each half buffer has 1/2 a line in which to be loaded -The store uses 9-bit addressing. Bit-9 indicates which buffer, -Total memory = 164x2x64 = 20992-bits

-Therefore the data will be updated at most every 1290240 cycles.

-From the specification, we must be able to process 2 dots/cycle.

-126 lines contains 20480x126 = 2580480 dots.

Once all this data is loaded it will be valid for at least 126 lines.

i.e. for a 12,8 inch line it has 10240 dots or 5120 cycles

for an 8 inch line it has 6400 dots or 3200 cycles
